

Denoise fMRI gradient interference on electrophysiological signals: using IS-NMF

IS: Itakura-Saito (IS) divergence

NMF: Nonnegative Matrix Factorization

Presented by: Hongbiao Chen

Supervisor: Dr. Michel Besserve

Overview

Simultaneous functional magnetic resonance imaging (**fMRI**) and electrophysiological (**Ephy**) recording induces fMRI gradient interference in Ephy signals. After **hardware compensation**, **IS-NMF denoise** can effectively remove residual artifacts and generate high quality Ephy data.

- **Problem:** fMRI gradient artifacts in Ephy signals
- **Method:**
 - **Hardware:** interference-compensation circuits;
 - **Software:** AAS (average artifact subtraction), PCA, NMF.
- **Results:** IS-NMF denoising workflow
- **Summary and Future** Improvement

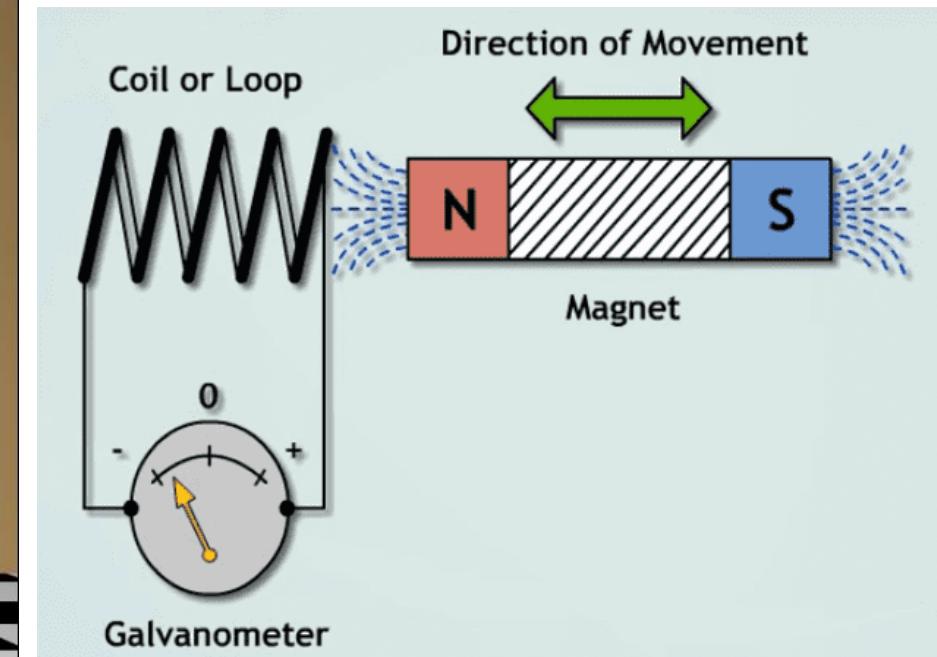

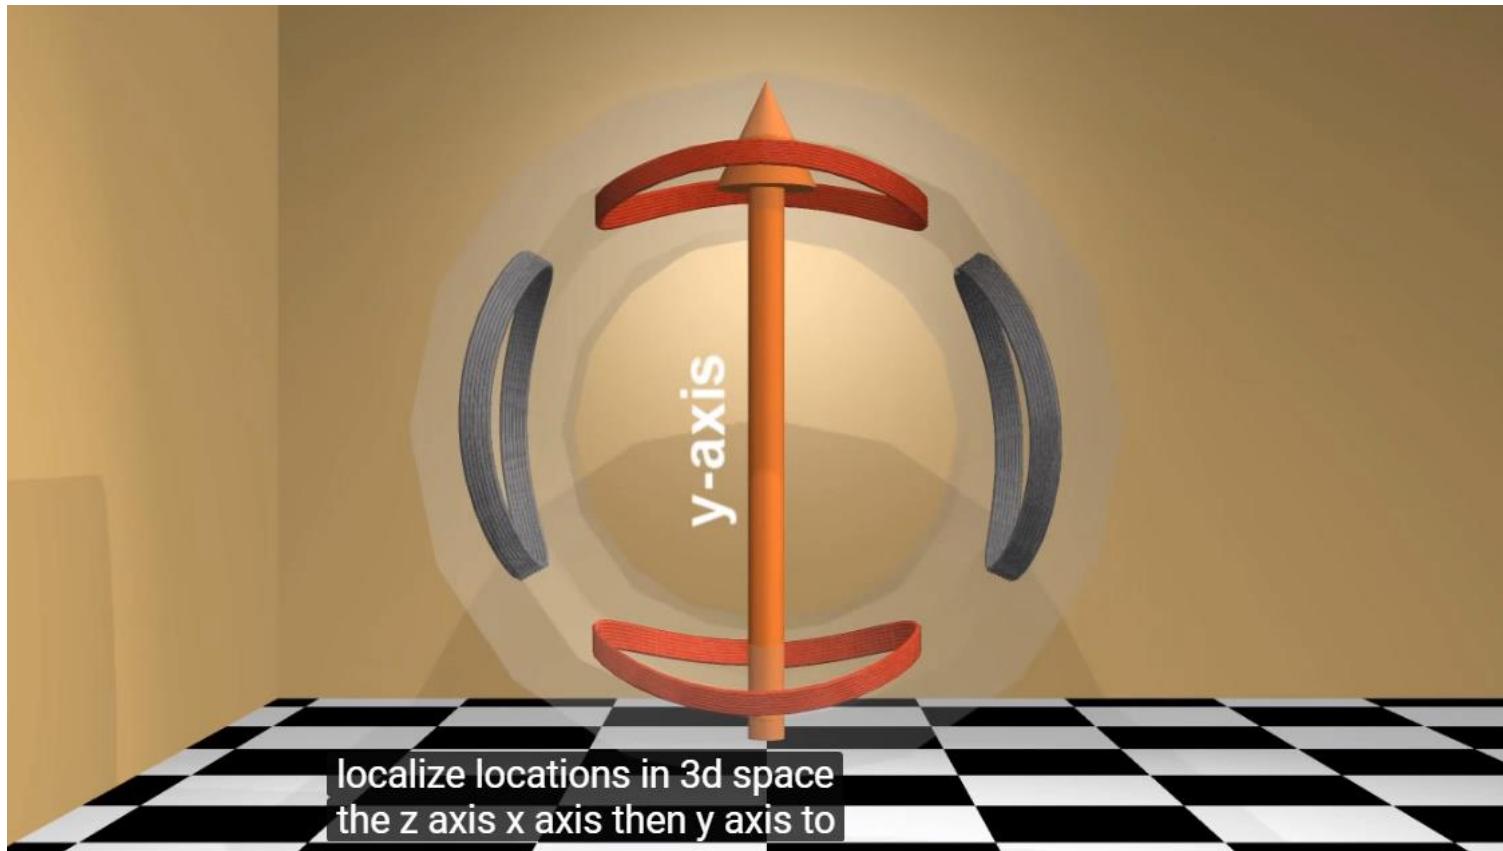

Problem: fMRI gradient artifacts in Ephy

Raw electrophysiological signals contain **gradient artifacts** during **MRI imaging**

Problem: fMRI gradient artifacts in Ephy

(Dr. Klioze, 2013) [2]
Faraday's law picture electrical4u.com

fMRI performs rapidly **switching magnetic field** gradients,
which results in **gradient interference** on Ephy signals based on **Faraday's law**.

Methods to denoise gradient artifacts

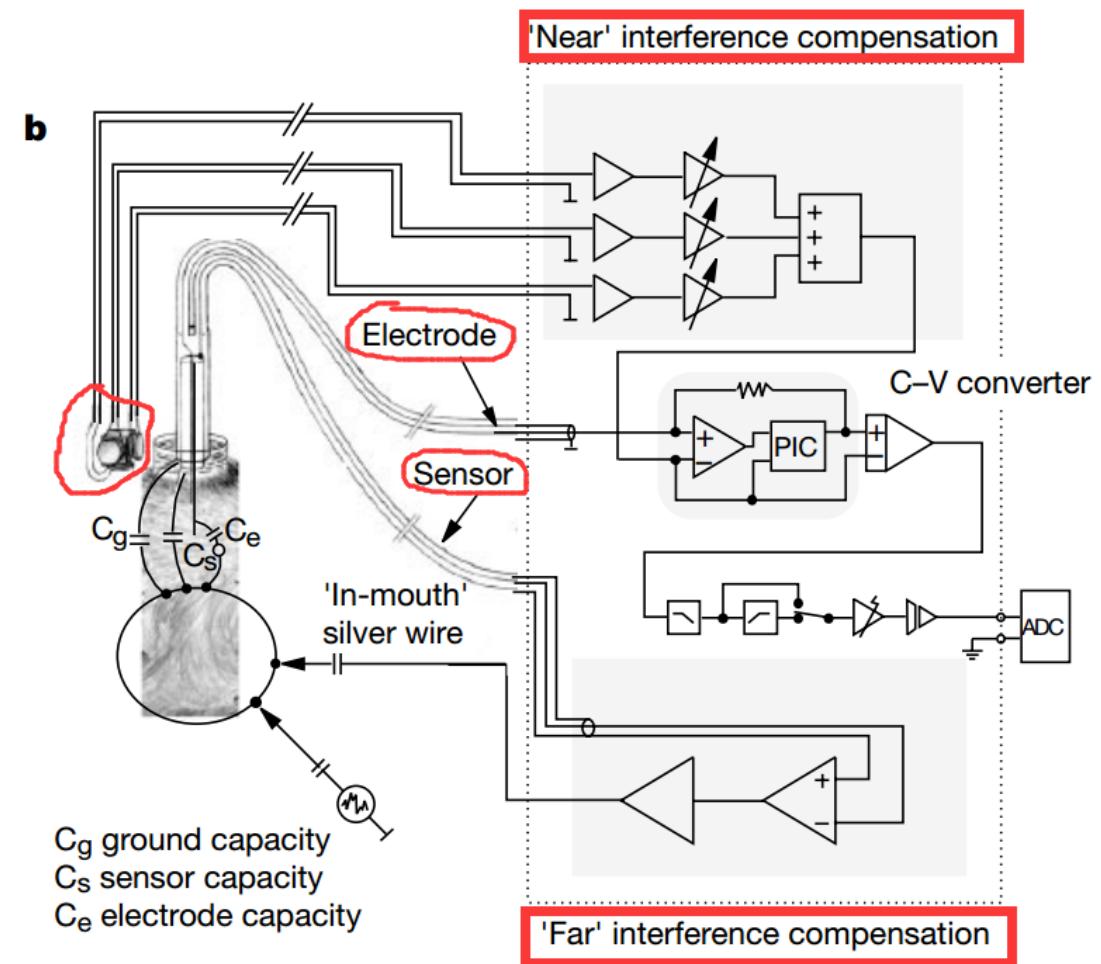

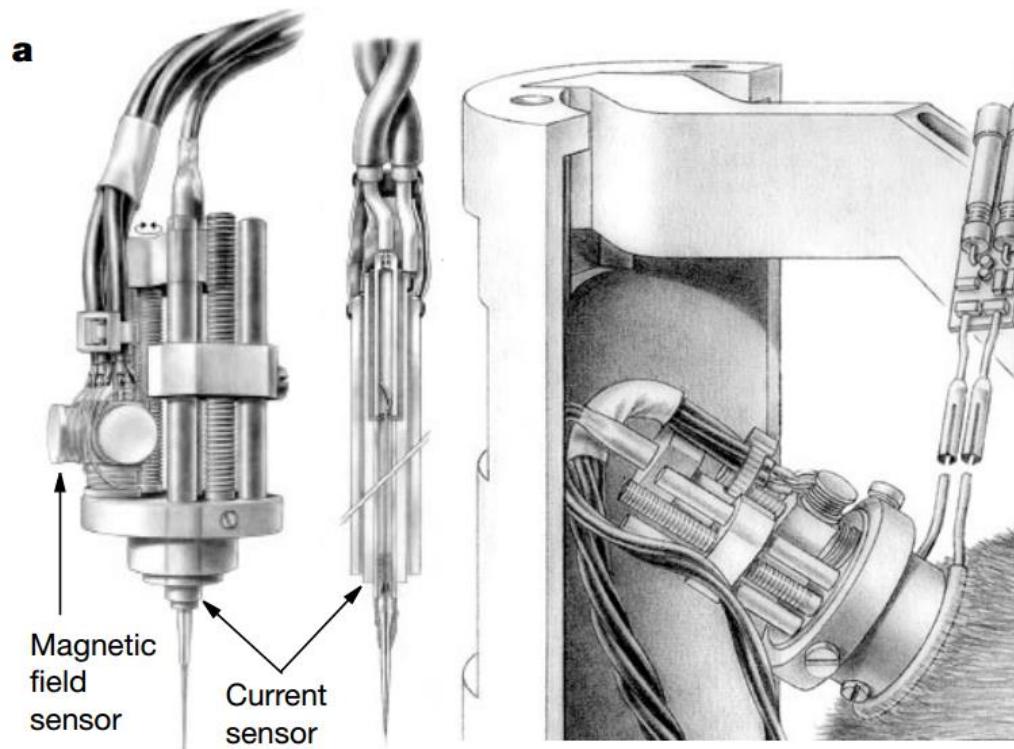

Methods	Description
Hardware-based	Temporal filtering (remove gradient artifacts frequency band)
	Reference gradient signals (near and far interference compensation circuits)
Software-based	Average artifact template subtraction (AAS) (average time-aligned signals for each noise pattern)
	Extract hidden noise components <ul style="list-style-type: none"> - Principal component analysis (PCA) - Independent component analysis (ICA) - Nonnegative matrix factorization (NMF)

“**Noisy Ephy signal** (recorded) = Original Ephy signal (hidden) + **Noise pattern signal** (hidden)”

Hardware Solution: compensation circuits

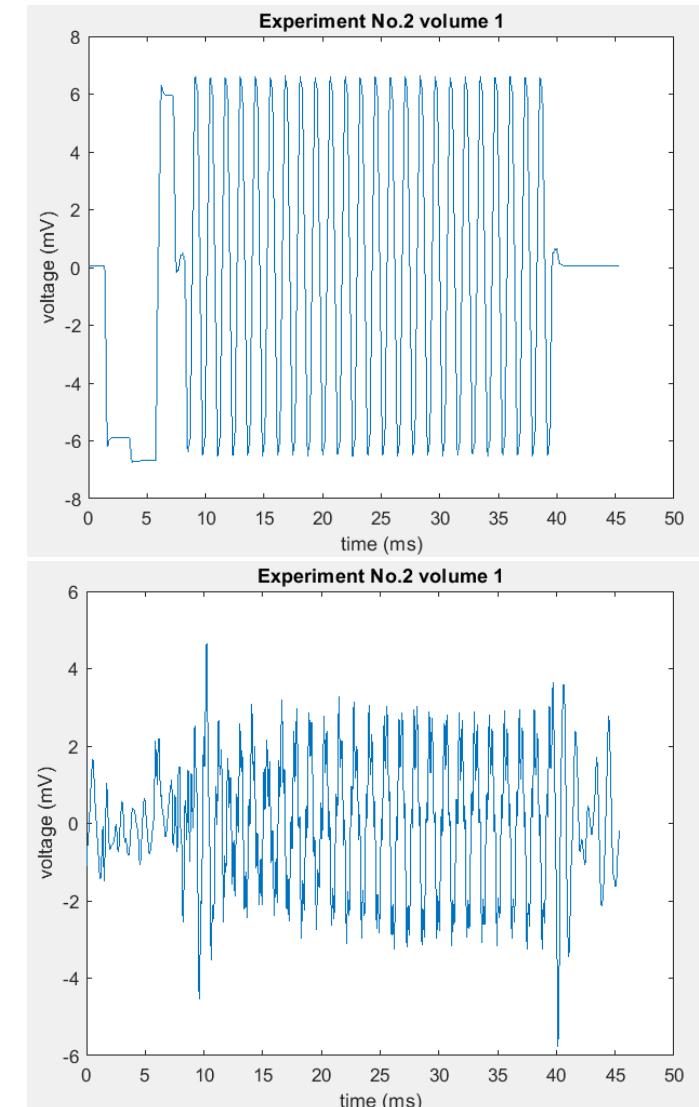

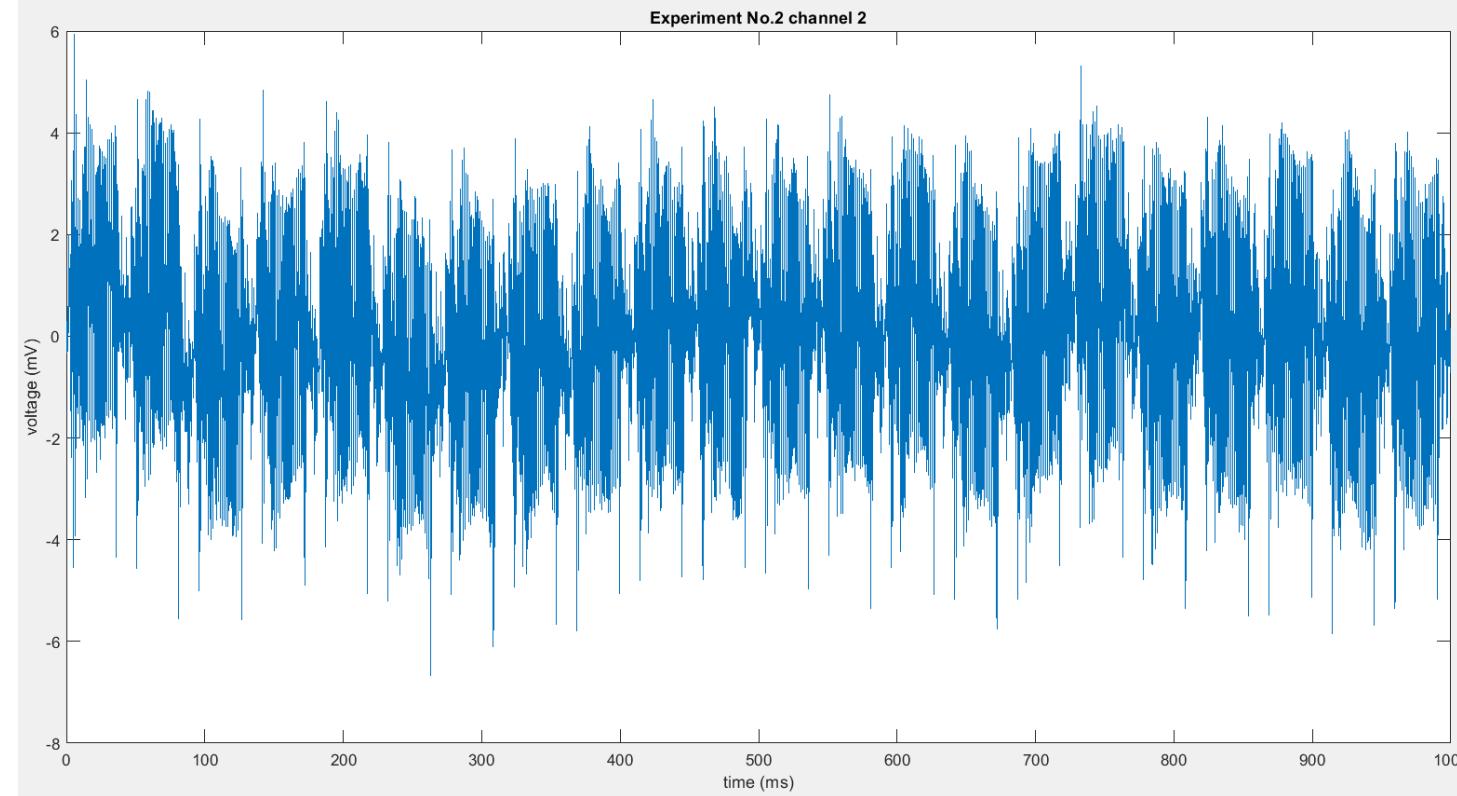

Two separate **interference-compensation circuits**:

- **Near interference** (induction within electrodes)
- **Far interference** (induction between electrodes and the ground)

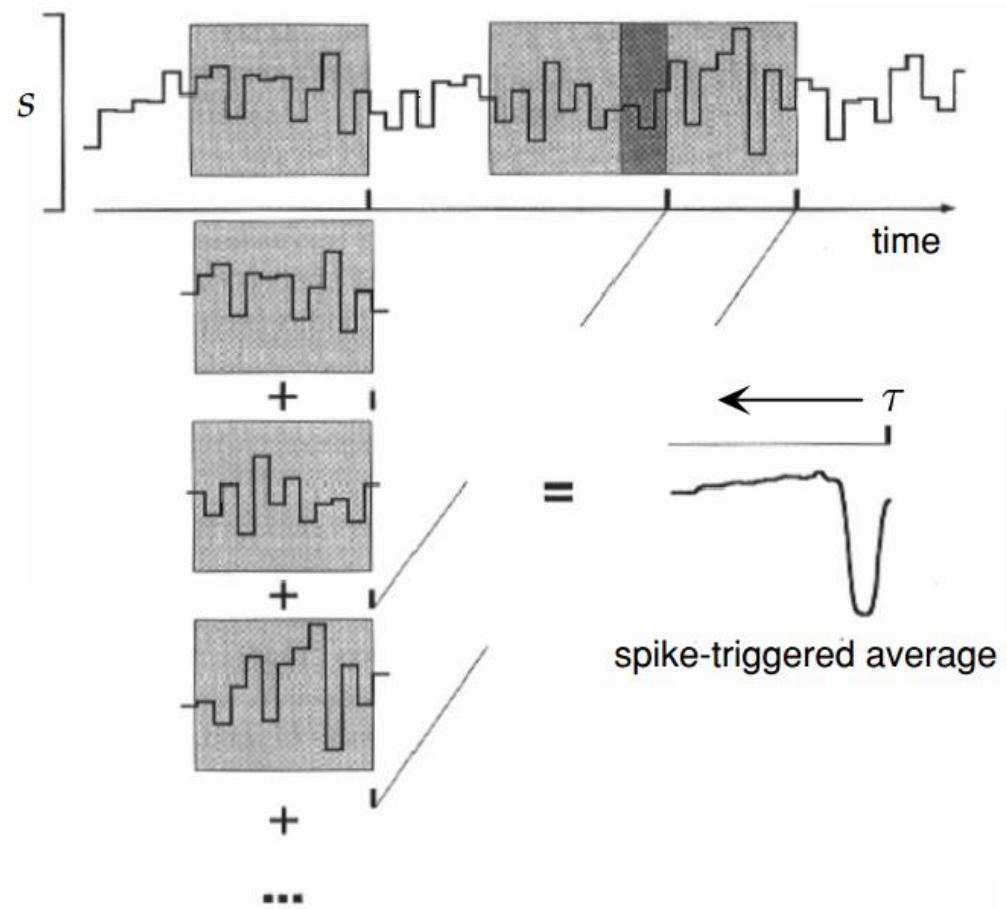

Software Solution: AAS

“Original Ephy signal = **Noisy Ephy signal** (recorded) - **Noise pattern signal** (hidden)”

Software Solution: AAS

AAS, average artifact template subtraction, is a conventional way to find the hidden noise structure like using **spike-triggered average (STA)** stimulus to estimate the receptive field.

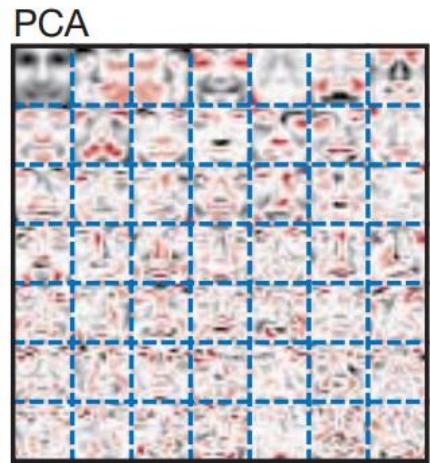

Receptive field → Noise pattern
 Other noisy stimulus → Original Ephy signals
 Each spike timestamp → Each chunk scan timestamp

1. **Align** (chunks = slices * segments) in volumes
2. **Average** (precise synchronization in MRI-Ephy)
3. **Subtract** (compared with reference noise pattern)

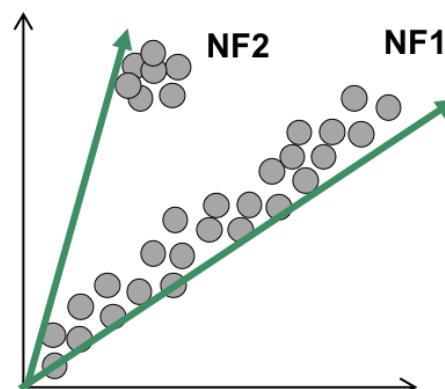

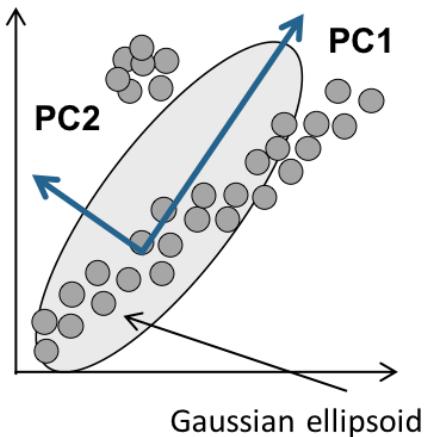

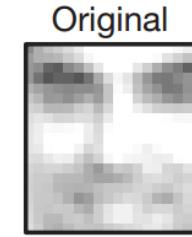

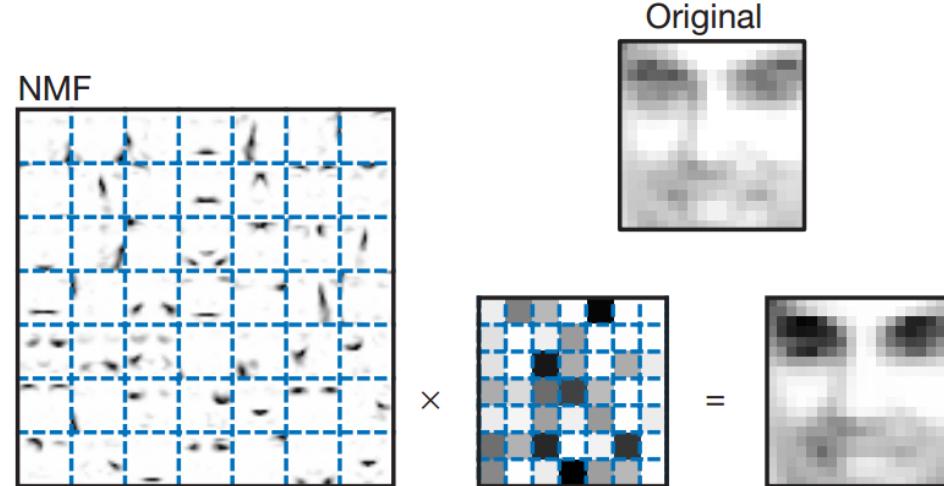

Software Solution: PCA, NMF

(Lee et al., 1999) [6]

$$\begin{matrix} V \\ \left[\begin{array}{|c|c|c|c|c|c|} \hline \text{Blue} & \text{Blue} & \text{Blue} & \text{Blue} & \text{Blue} & \text{Blue} \\ \hline \text{White} & \text{White} & \text{White} & \text{White} & \text{White} & \text{White} \\ \hline \text{White} & \text{White} & \text{White} & \text{White} & \text{White} & \text{White} \\ \hline \text{White} & \text{White} & \text{White} & \text{White} & \text{White} & \text{White} \\ \hline \end{array} \right] \end{matrix} * \begin{matrix} H^T \\ \left[\begin{array}{|c|c|c|c|} \hline \text{Blue} & \text{Blue} & \text{Blue} & \text{Blue} \\ \hline \text{White} & \text{White} & \text{White} & \text{White} \\ \hline \text{White} & \text{White} & \text{White} & \text{White} \\ \hline \text{White} & \text{White} & \text{White} & \text{White} \\ \hline \end{array} \right] \end{matrix} \approx \begin{matrix} W \\ \left[\begin{array}{|c|c|} \hline \text{Blue} & \text{Blue} \\ \hline \text{White} & \text{White} \\ \hline \text{White} & \text{White} \\ \hline \text{White} & \text{White} \\ \hline \end{array} \right] \end{matrix}$$

Columns of W: transformation of V

Rows of H (columns of H^T): contribution of V to W

Software Solution: Itakura-Saito divergence

The optimization problem:

$$\min_{\mathbf{W}, \mathbf{H} \geq 0} D(\mathbf{V} \mid \mathbf{WH}),$$

where $D(\mathbf{V} \mid \mathbf{WH})$ is a cost function defined by

$$D(\mathbf{V} \mid \mathbf{WH}) = \sum_{f=1}^F \sum_{n=1}^N d([\mathbf{V}]_{fn} \mid [\mathbf{WH}]_{fn}),$$

and where $d(x \mid y)$ is a scalar cost function.

(1) Euclidean distance:

$$d_{EUC}(x \mid y) = \frac{1}{2}(x - y)^2$$

(2) Kullback-Leibler (KL) divergence:

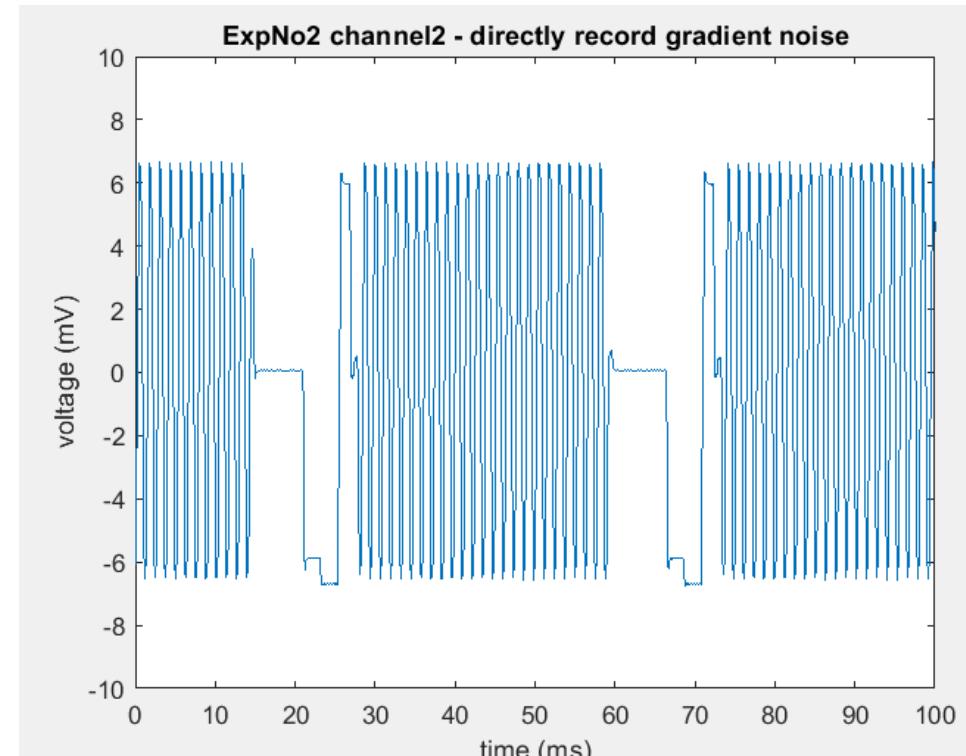

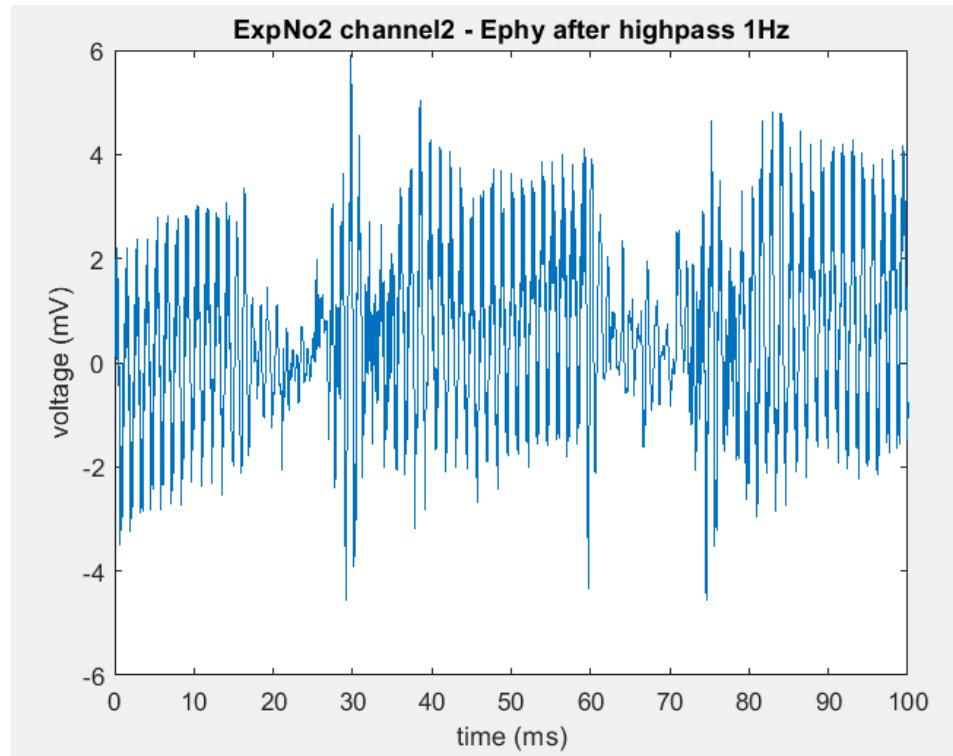

$$d_{KL}(x \mid y) = x \log \frac{x}{y} - x + y$$

(3) Itakura-Saito (IS) divergence:

$$d_{IS}(x \mid y) = \frac{x}{y} - \log \frac{x}{y} - 1$$

Results: IS-NMF denoising workflow

1. **Synchronize** MRI-Ephy;
2. **Highpass filtering** (1Hz);
3. **Align** Ephy chunks for each unique noise pattern;

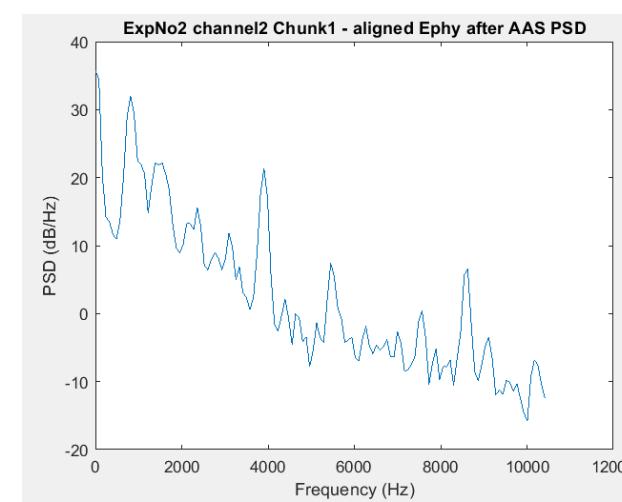

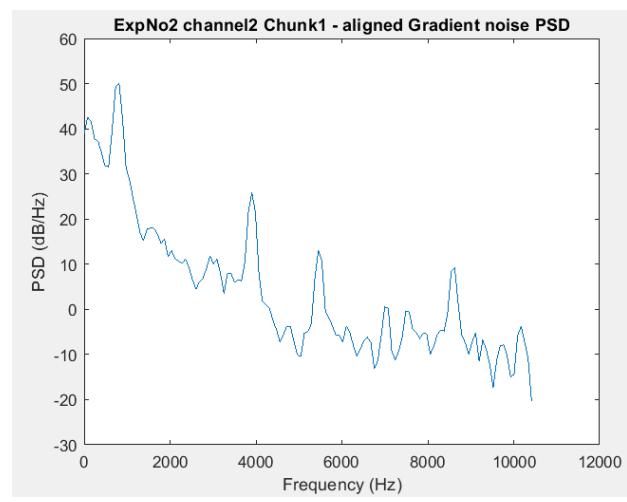

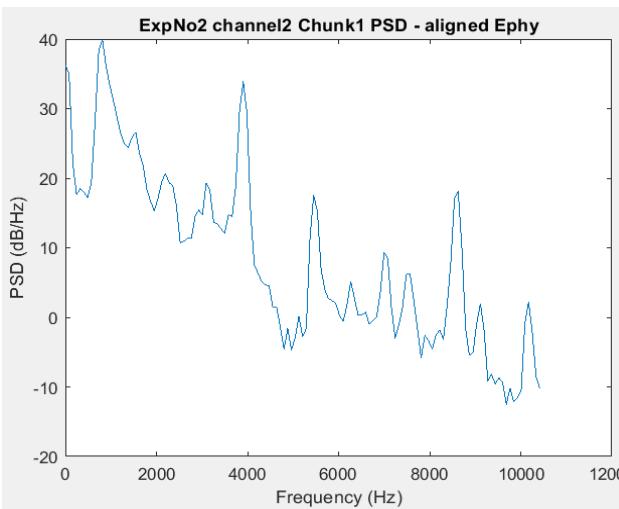

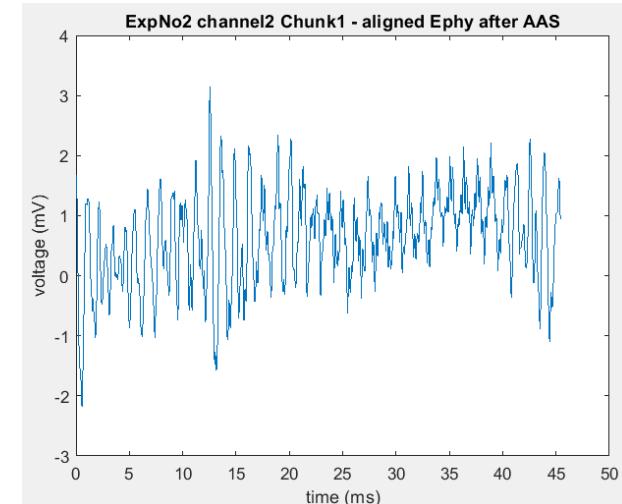

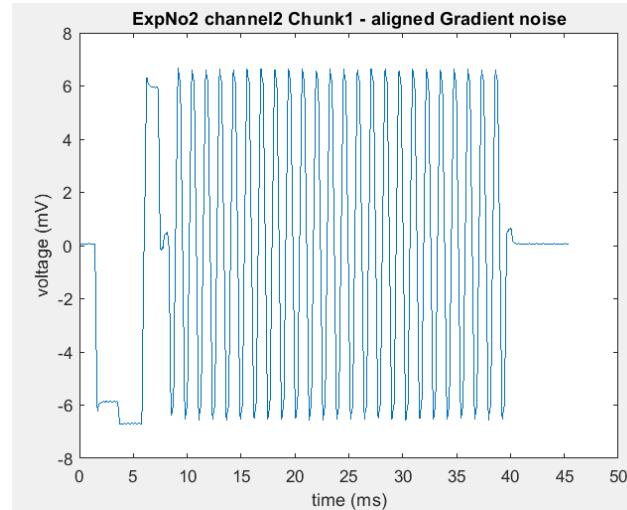

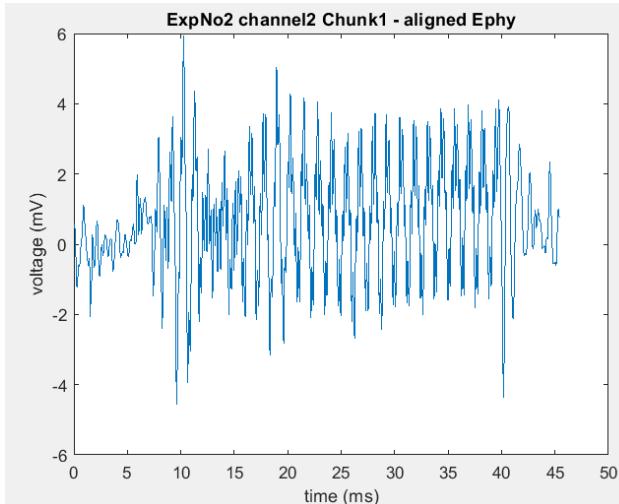

Results: IS-NMF denoising workflow

4. Perform AAS, and construct gradient noise pattern list;

5. Perform IS-NMF

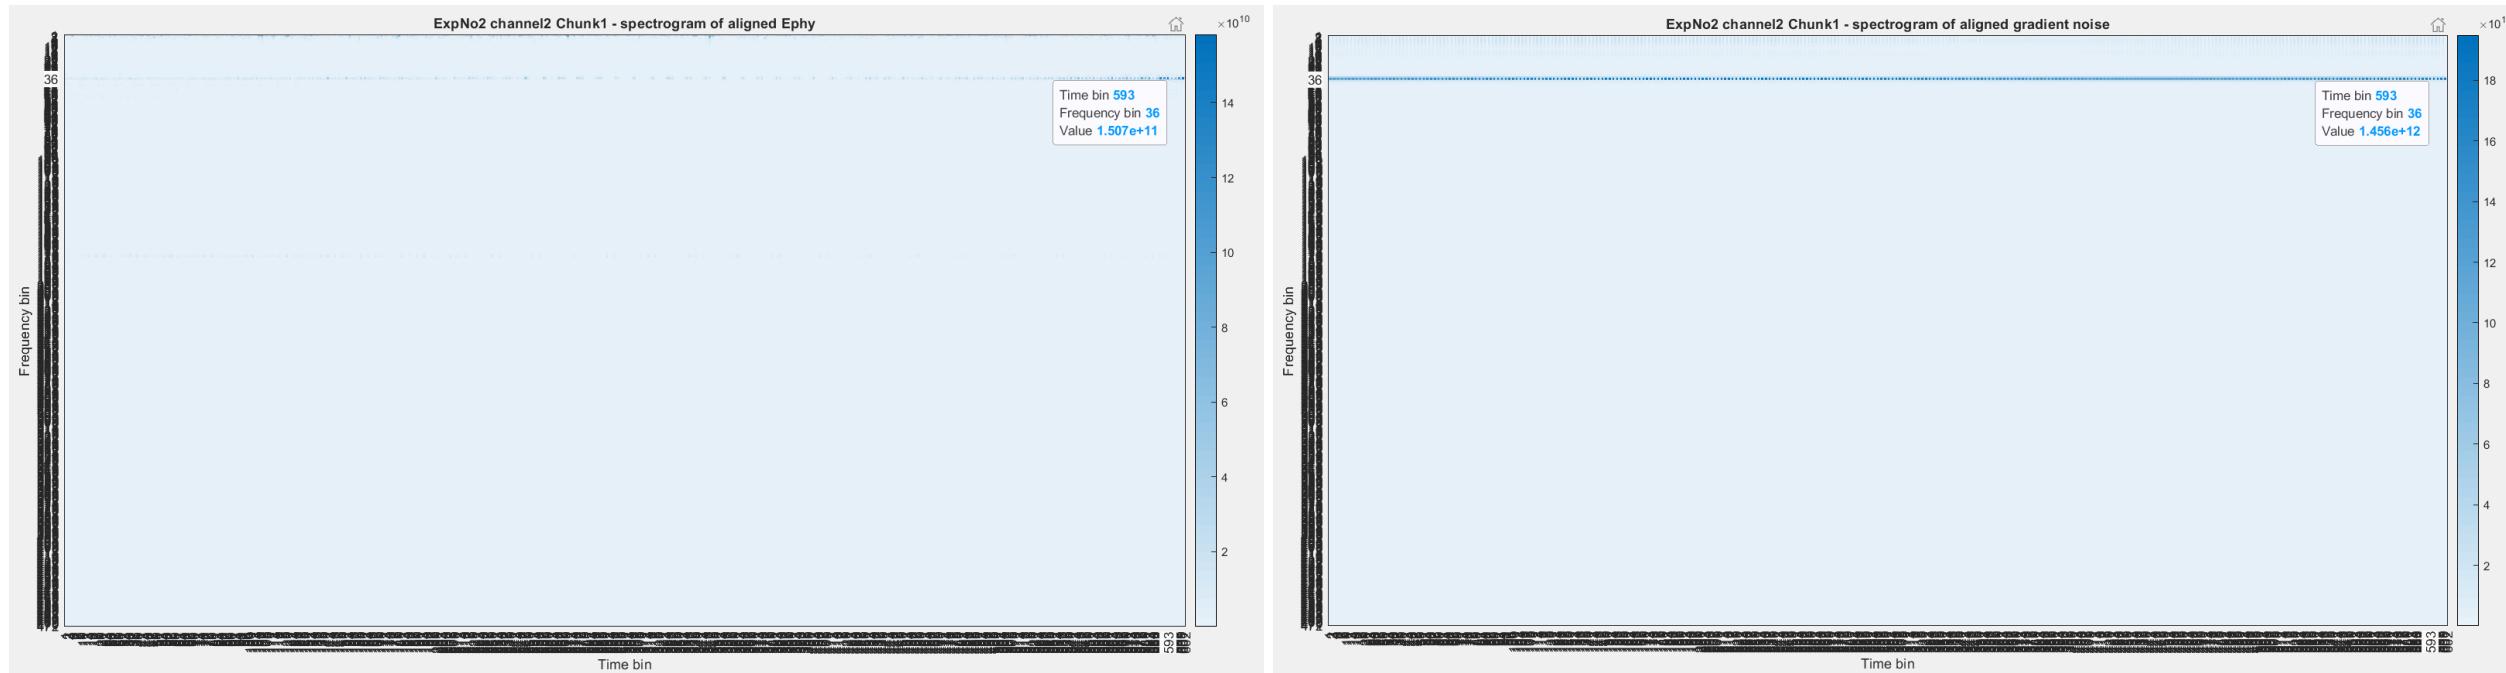

5.1 Preprocess

Results: IS-NMF denoising workflow

5.2 Do STFT

5.3 Do IS-NMF on Spectrogram (V matrix)

Results: IS-NMF denoising workflow

Assumptions of IS-NMF:

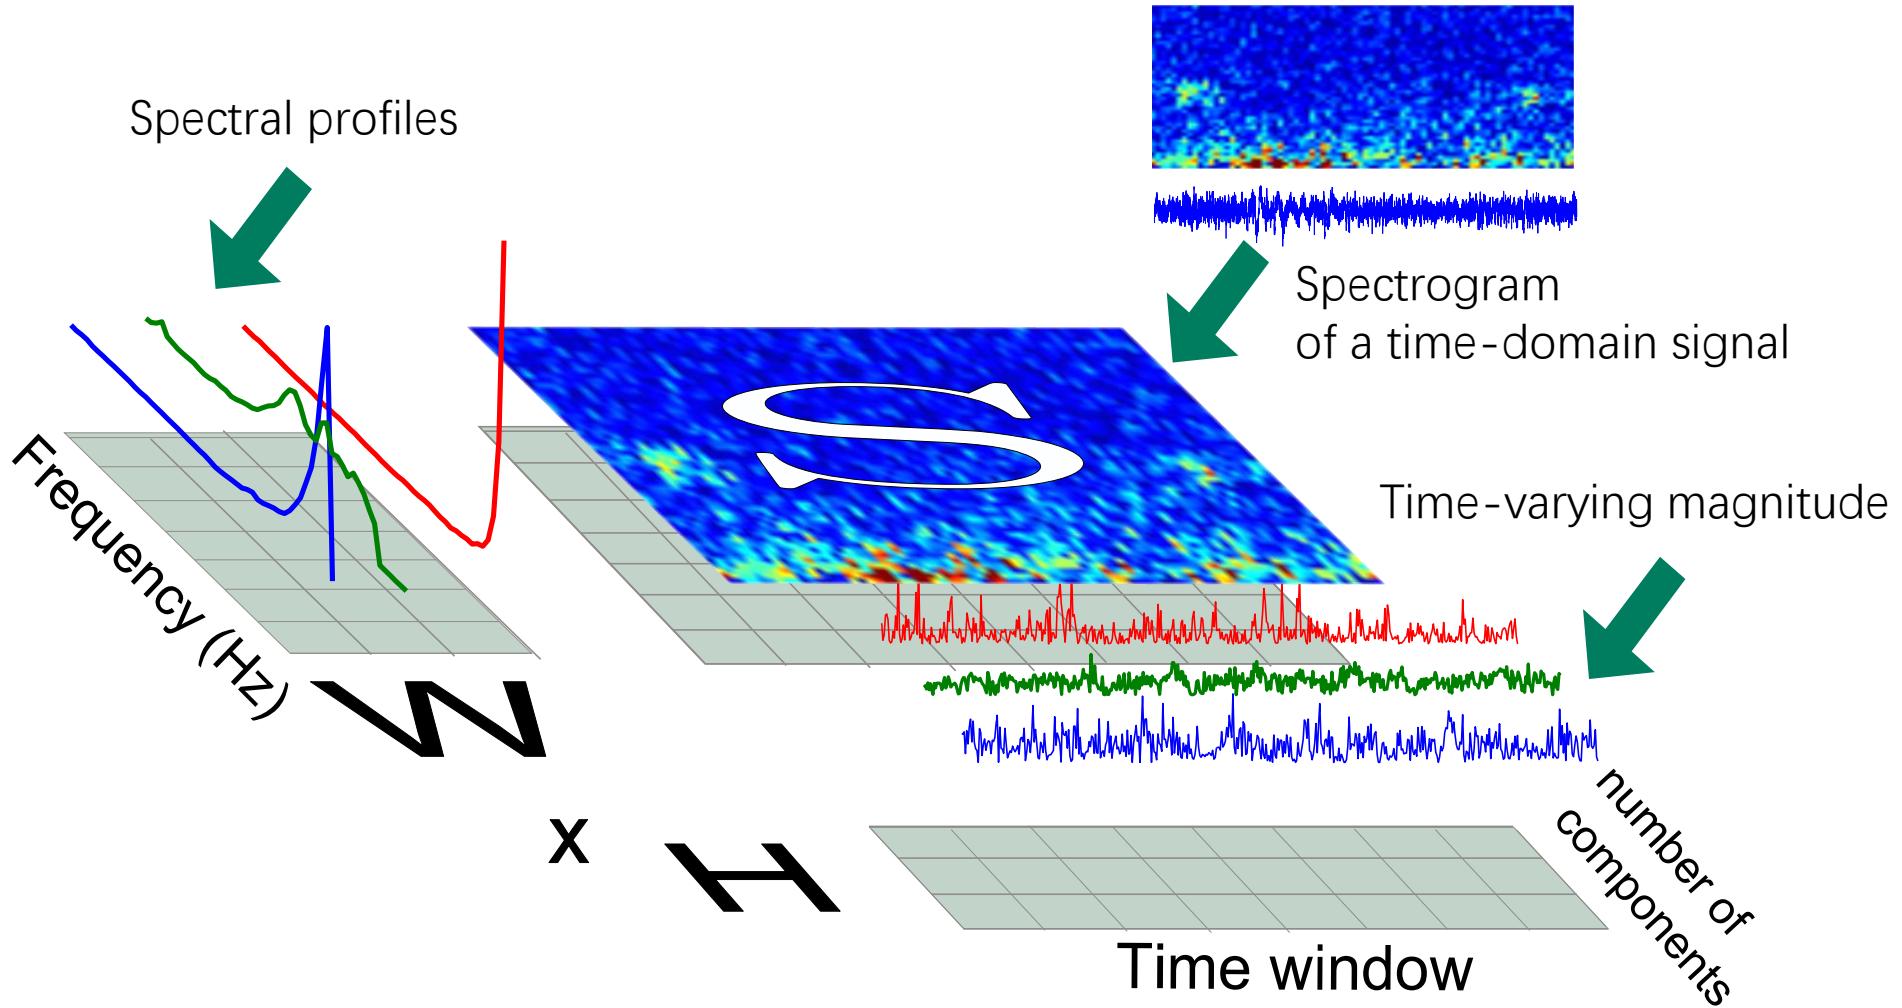

The **spectrum** of the **chunk-unfolded Ephy signal** (matrix **V**) is a time varying linear combination of components associated to **neural activity** and **gradient noise**:

$$S(f,t) = w_{\text{neur}}(t).S_{\text{neur}}(f) + w_{\text{grad}}(t).S_{\text{grad}}(f) + \dots.$$

Objective:

Identify these components,
and remove the time varying contribution of **gradient noise**.

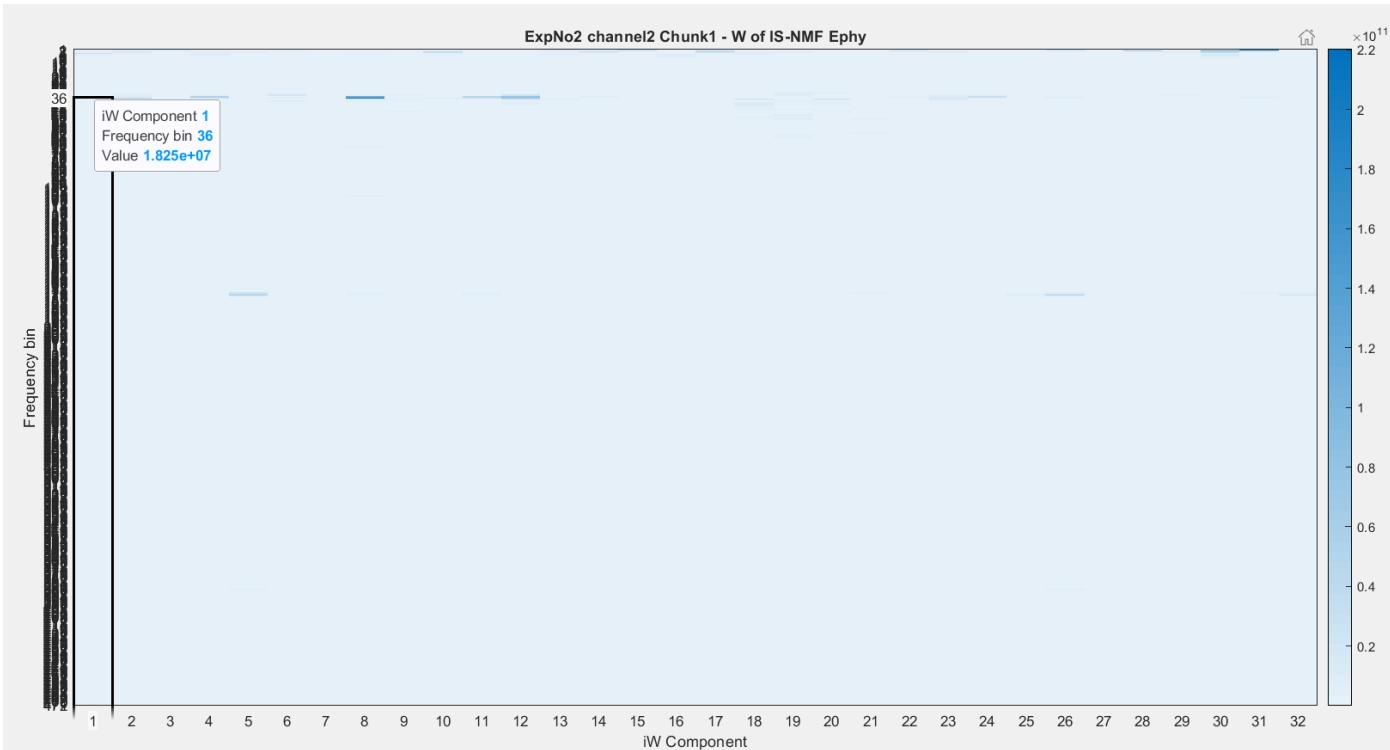

Results: IS-NMF denoising workflow

$$S \approx WH$$

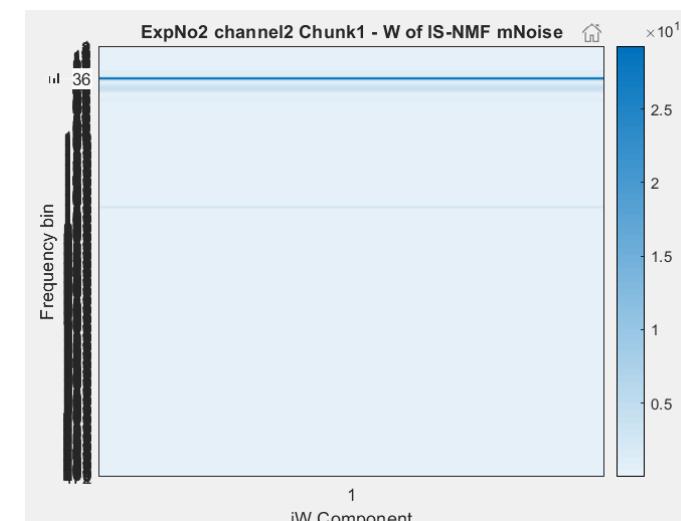

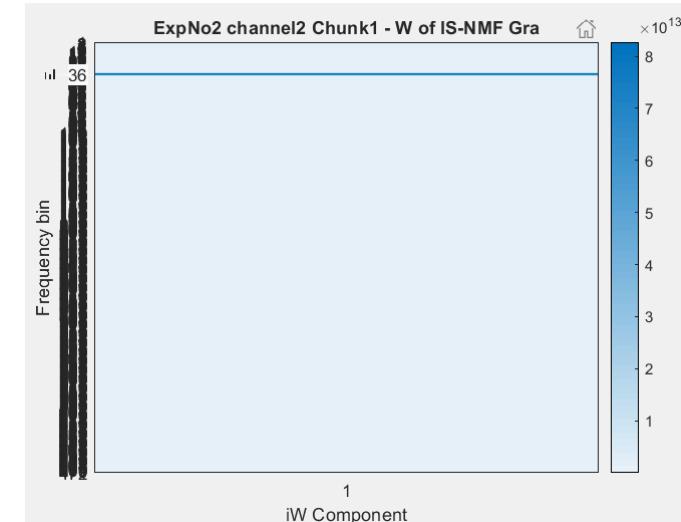

Results: IS-NMF denoising workflow

5.4 Remove best **noise-correlated components** (columns in **W** matrix)

Correlated iWs (coeff threshold 0.5) are

[2 4 6 8 9 11 12 18 19 20 23 24]

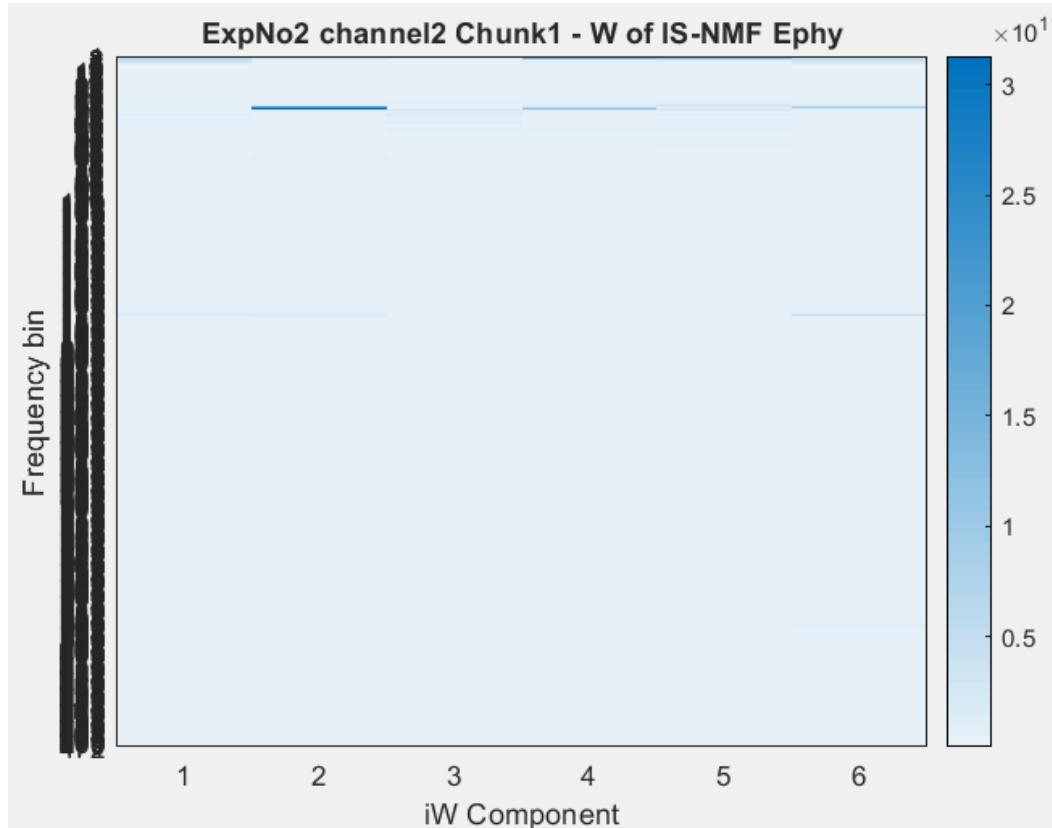

Gradient noise pattern list

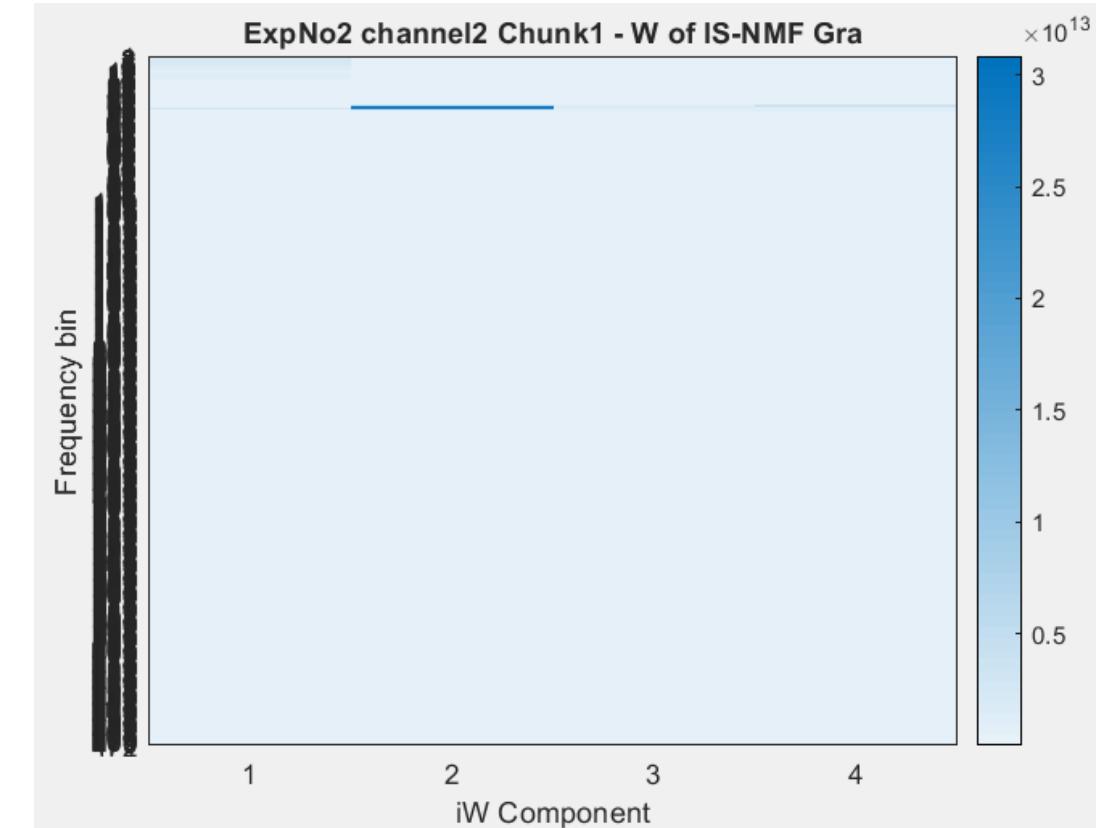

Results: IS-NMF denoising workflow

Depends on the data itself:

The number of hidden components can not **too small** or **too large**.

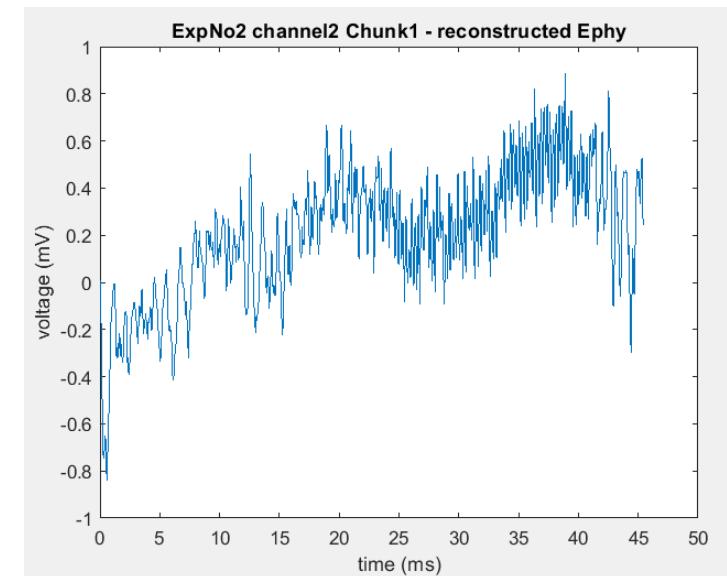

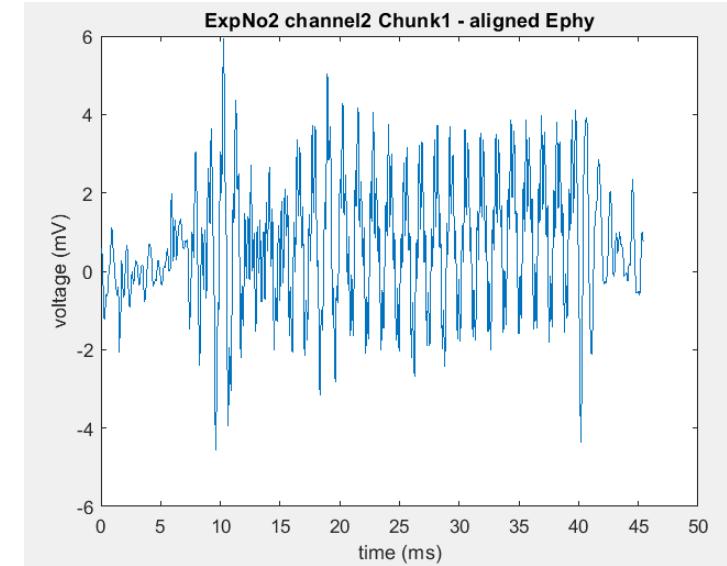

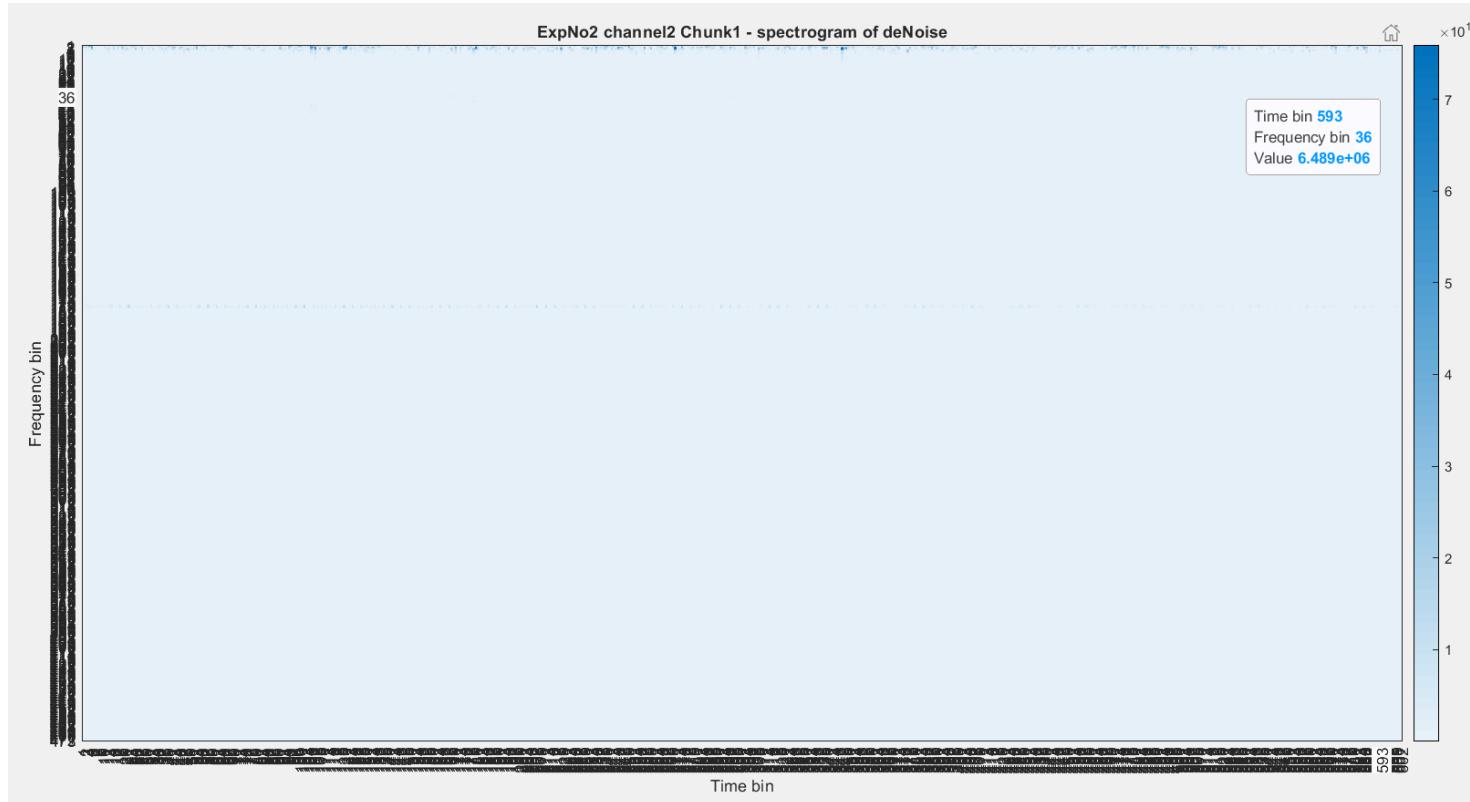

Too little components in the **Ephy Signal** case

Too many components in the **Gradient Signal** case

Results: IS-NMF denoising workflow

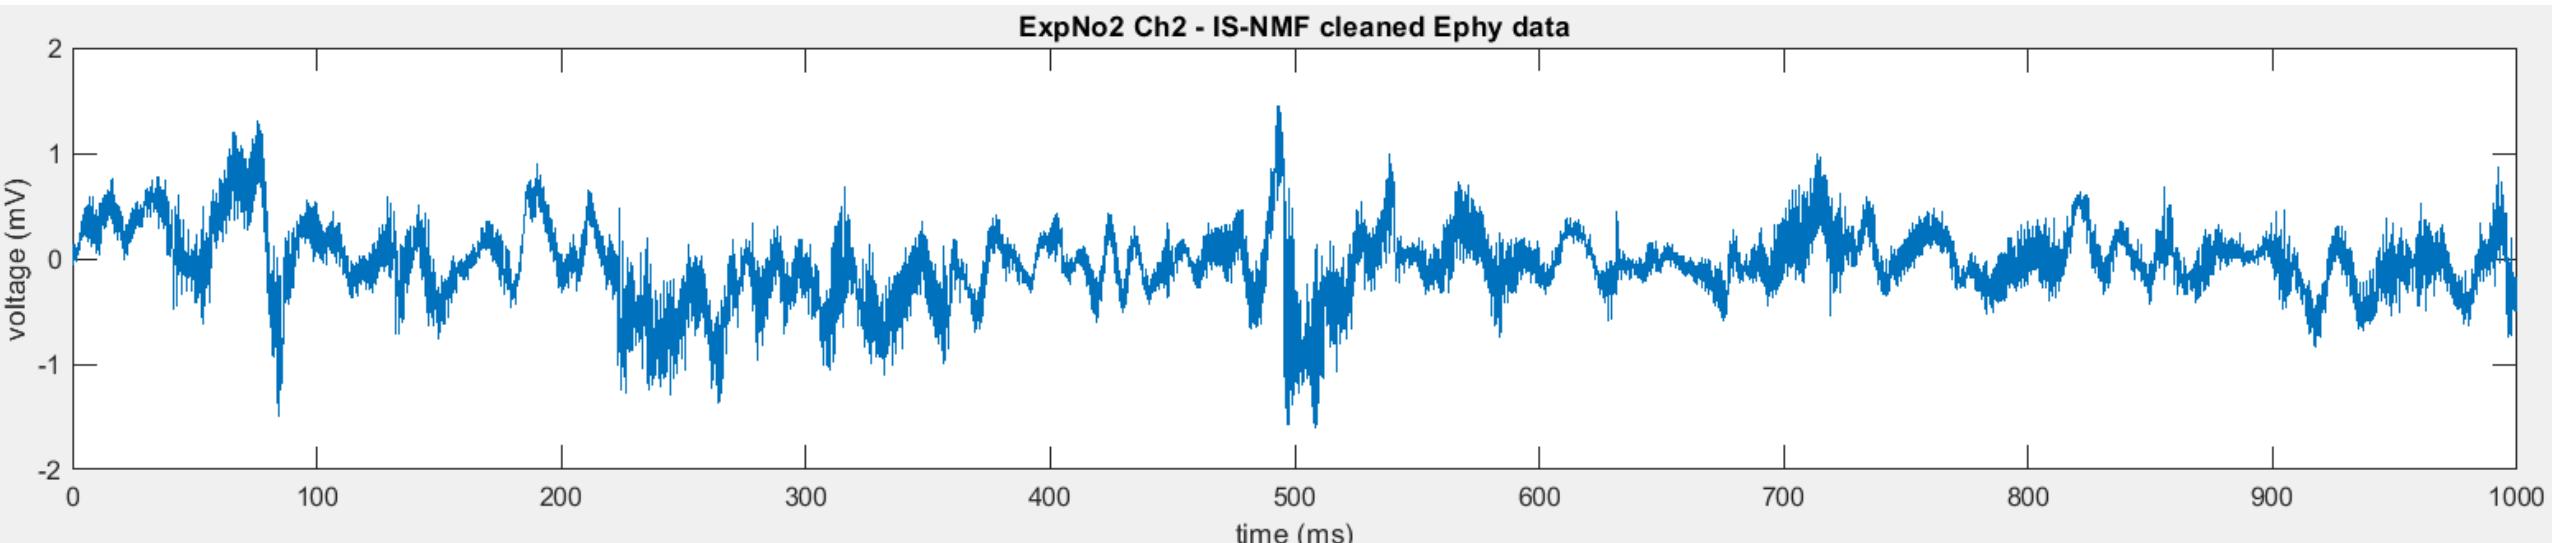

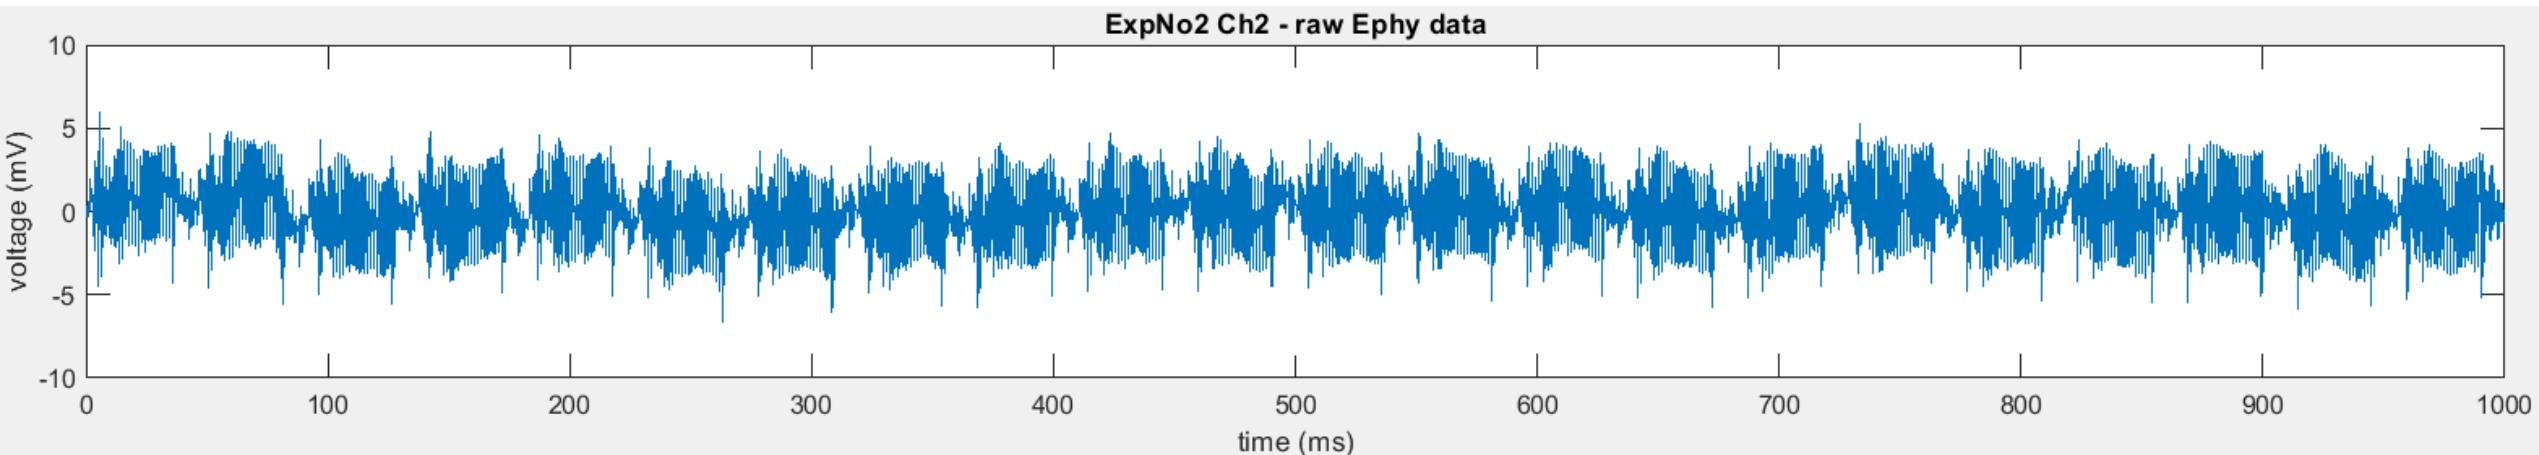

5.5 Reconstruct via **Wiener filter** (**H** matrix as coefficients) and **Inverse STFT**

Results: IS-NMF denoising workflow

6. Postprocess

7. Evaluation

Summary and Future Work

Summary

- **Noise source:** fMRI gradient artifacts
- **Solutions:**
 - **Hardware:** compensation circuits;
 - **Software:** AAS, PCA, **IS-NMF**.
- **Results:** IS-NMF denoising workflow

Future Work

1. Choose **N hidden components**
2. Local minima and **convergence**
3. Ground truth for **feedback learning**
